

TREMEC[®]

Torque Transfer Solutions[™]

Virtual ECUs for high performance
transmissions

*Presented by:
Ewaut Dewinter
Application software engineer*

A **kuo**  Group Company

Contents

- Tremec and high performance DCTs
- Transmission controls and Application Software
- Simulation and testing philosophy
- Performant Simulation Environment

Tremec develops and produces high performance transmissions

TREMEC key facts

- Fully owned subsidiary of Kuo Group
- Focus on high torque/high requirements
- Leader in performance transmissions & transmission subsystems
- Active in performance Dual Clutch Transmission systems since 2003
- Active in Europe, USA, Mid & South America
- 1.650 employees
- 225 m\$ turnover LTM 2017

KUO key facts

- Controlled by Senderos family
- Long term strategic holding company
- Activities in:
 - Consumer – food
 - Chemical – synthetic rubber & polystyrenes
 - Automotive – transmissions & aftermarket
- Active in 70 countries – HQ in Mexico City
- 20.000 employees
- 2.100m\$ turnover LTM 2017

Tremec Belgium focuses on DCT hardware and software

Sales & program management office for North-American OEM's

USA – Wixom MI

TREMEC center of competence for development & production of performance DCT transmissions & subsystems

- Hardware development of DCTs in the 600 Nm – 1000 Nm range
- Development of Controls hardware and Controls software

Belgium – Zedelgem

TREMEC center of competence for development & production of gear systems

Mexico – Querétaro

Contents

- Tremec and high performance DCTs
- Transmission controls and Application Software
- Simulation and testing philosophy
- Performant Simulation Environment

Tremec has expertise in all disciplines needed for transmission control

Electronics

- TCU using multicore technology
- Design compatible with multiple transmission configurations

OBD

- CARB 1968.2 compliance
- Electrical, Controller, Consistency and Performance Diagnostics

Base software

- AUTOSAR framework and Operating System
- Control and diagnostics of IO
- Communication with other ECUs

Safety software

- ISO 26262 compliance
- Safety goal monitoring

Application software

- High level functionality for drivability
- Mid level functionality for hydraulic and mechatronic control
- Model based algorithms
- Generic modules calibratable per application

Application software makes the difference in DCT applications

- A DCT gearbox can handle a **wide range of shift feelings**
- A **brand specific car temperament** can be created just by changing software
- **The same DCT gearbox** can be used **in different models**
 - different calibrations are used to match driveline experience with type of car

**Luxuriously
Comfortable**

**Ferociously
Sporty**

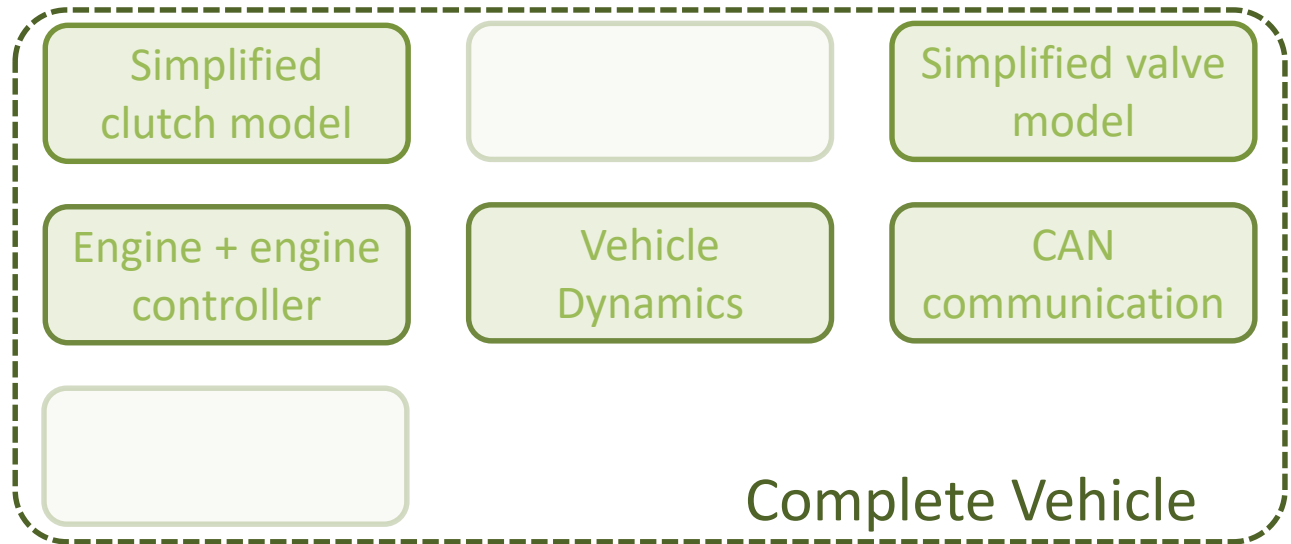

Contents

- Tremec and high performance DCTs
- Transmission controls and Application Software
- Simulation and testing philosophy
- Performant Simulation Environment

Complete powertrain simulation aids both the Hardware & Software design

HW: Component design
SW: Control algorithm development

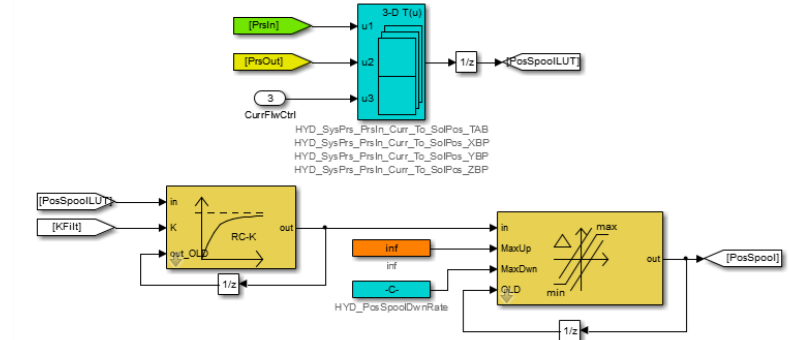

HW: System behavior
SW: Testing of complete application

Different simulation models are used for different goals

Detailed dynamics
Variable step solver
Focus on correct behavior
No focus on performance

Simplified dynamics
Fixed step solver
Focus on execution time
Approach real behavior

$$F_{Flow} = \iint_{C.S.} (\rho v_x \cdot \vec{v} \cdot \vec{n}) dA = \frac{\rho \cos \theta}{C_D A(x)} \cdot Q^2$$

Different simulation models are used for different goals

Detailed dynamics
Variable step solver
Focus on correct behavior
No focus on performance

Verifying hardware design
Developing dedicated
controls application

Simplified dynamics
Fixed step solver
Focus on execution time
Approach real behavior

Real-time testing of
application on a real or
virtual TCU

Contents

- Tremec and high performance DCTs
- Transmission controls and Application Software
- Simulation and testing philosophy
- Performant Simulation Environment

Business case

Tremec targets high performance applications

Parallel development of all components (short time to market)

- SW development needs to start before HW is finalized
- Limited availability of test vehicles

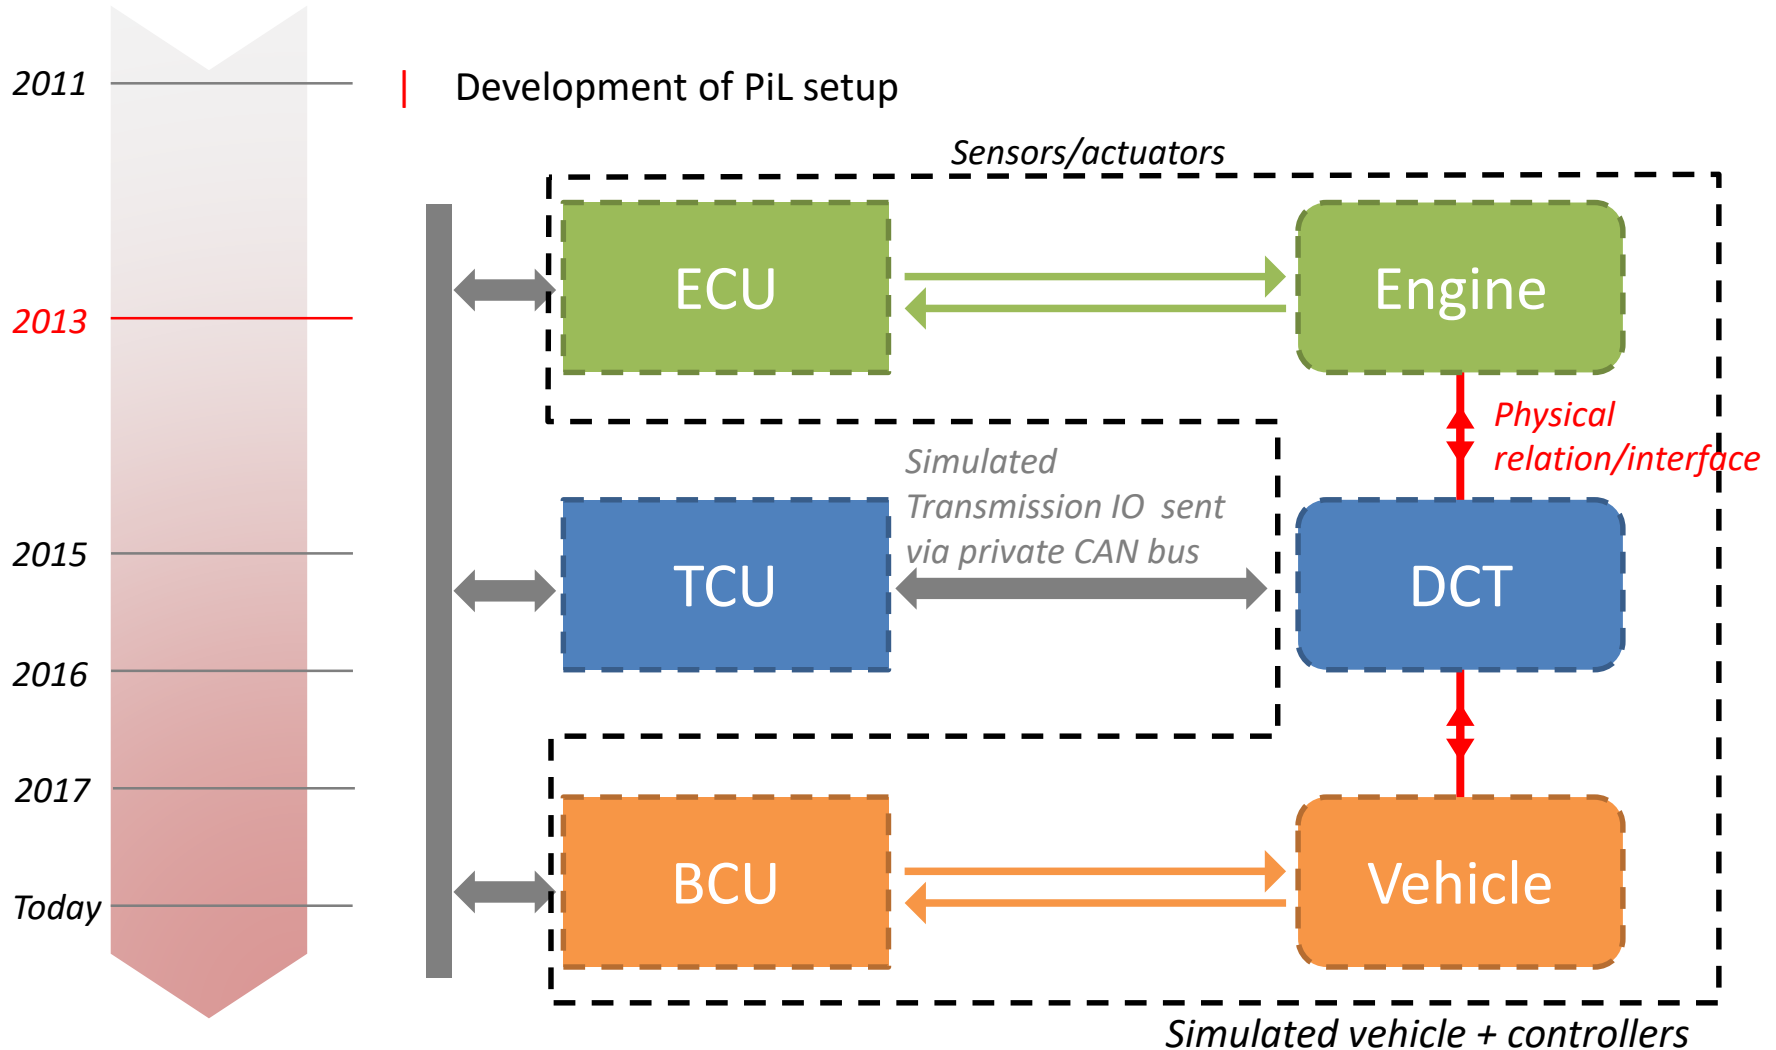

OEMs want unique character and stand-out features

- Agile SW implementation and testing environment
- Confidence in new algorithms before vehicle testing
- Possibility to explore new concepts and variants

**Tremec needs a performant simulation environment
to reach the desired SW maturity**

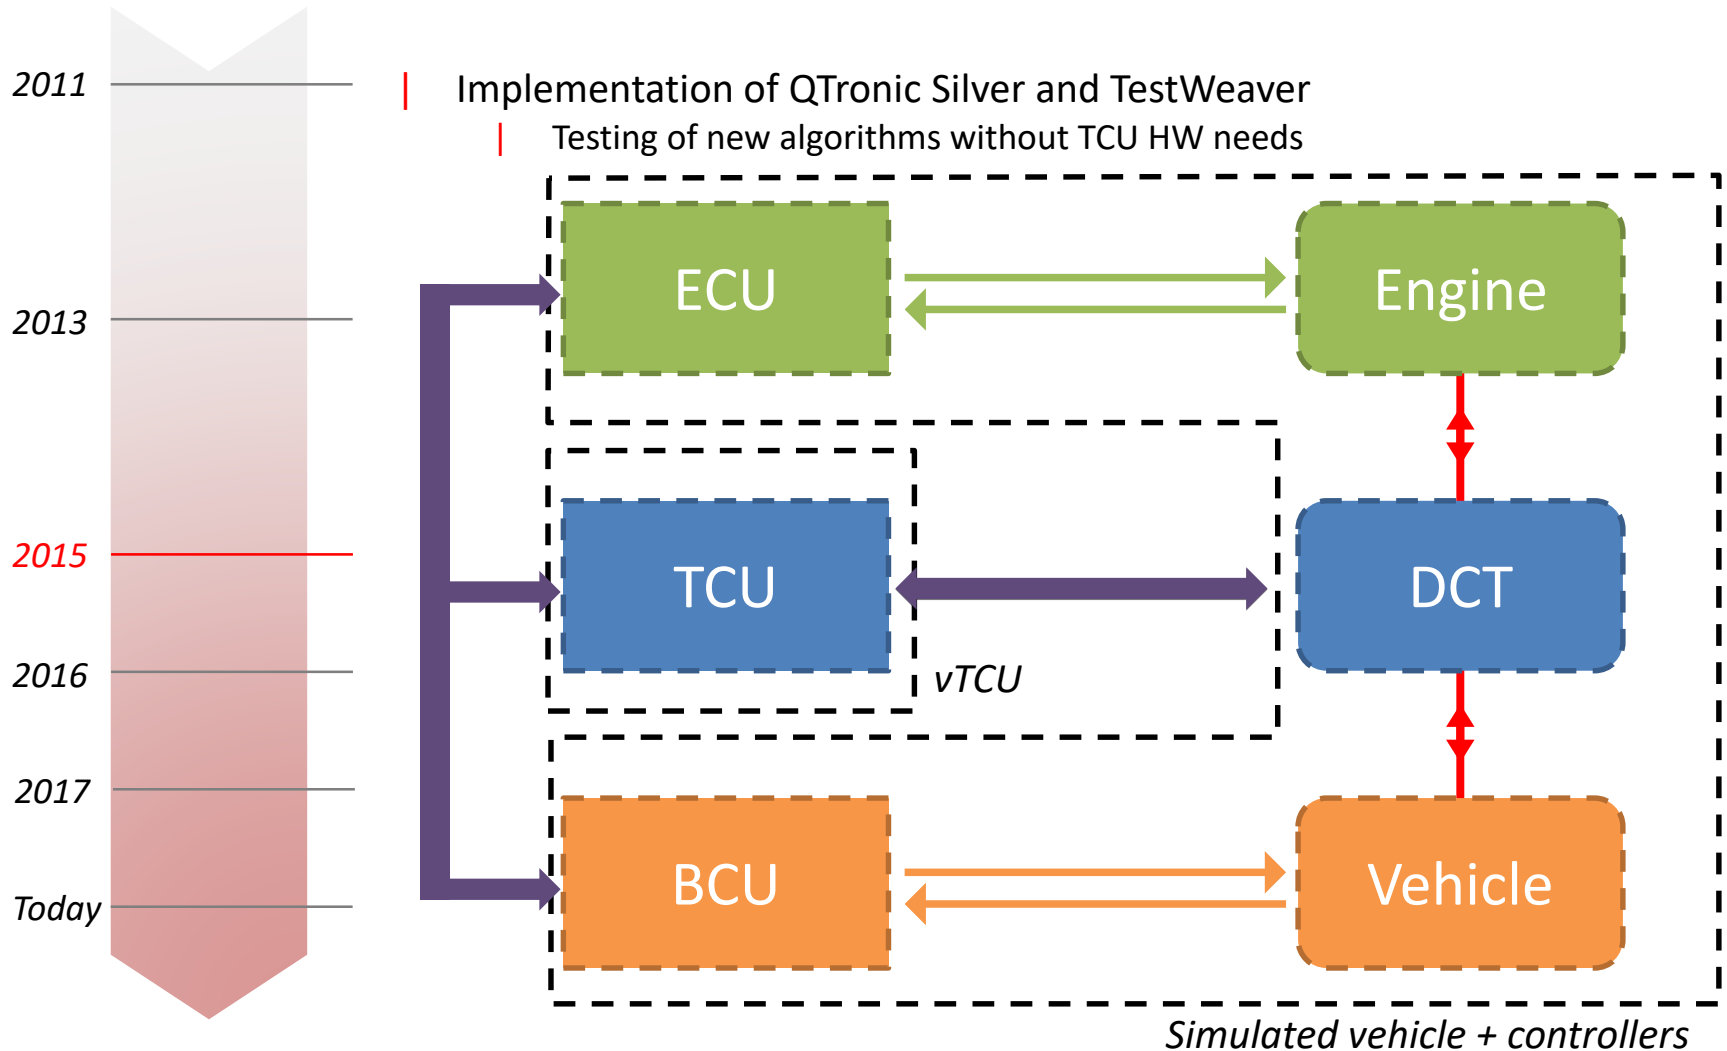

Performant Simulation Environment

PiL setup for full ASW testing

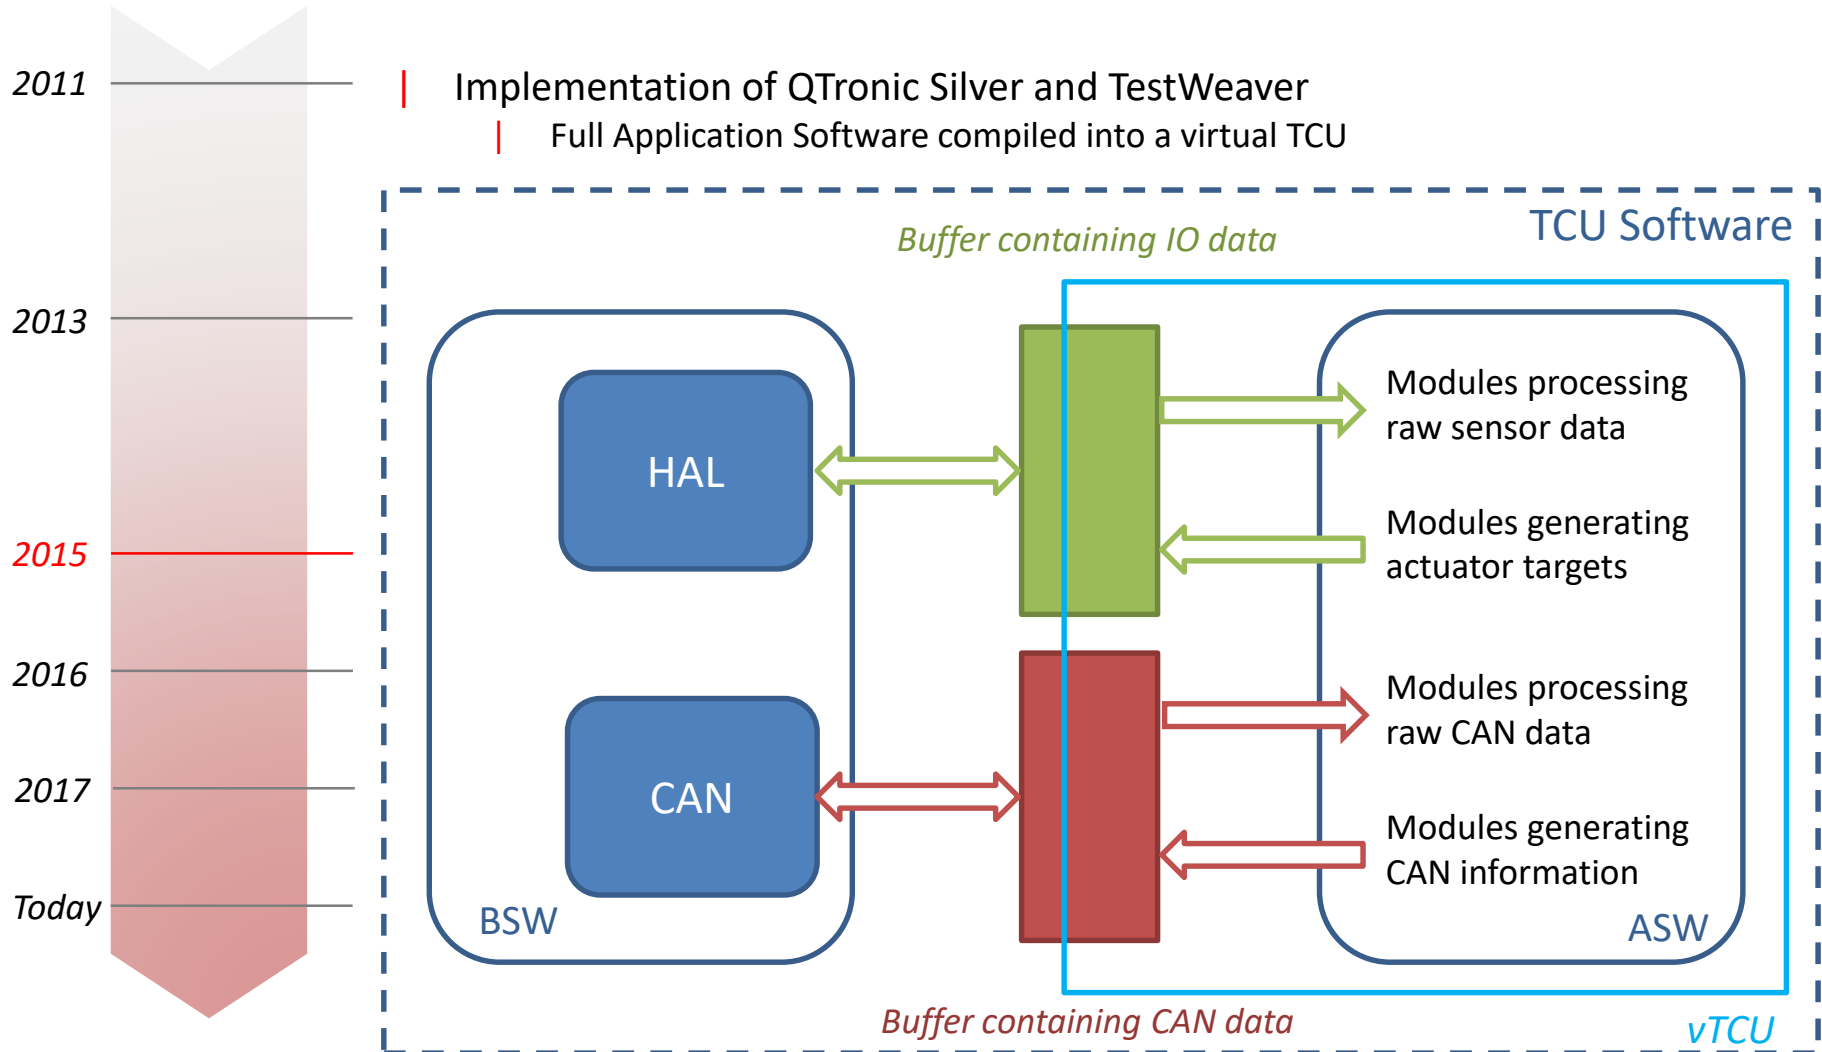

Performant Simulation Environment

Further steps towards SiL testing

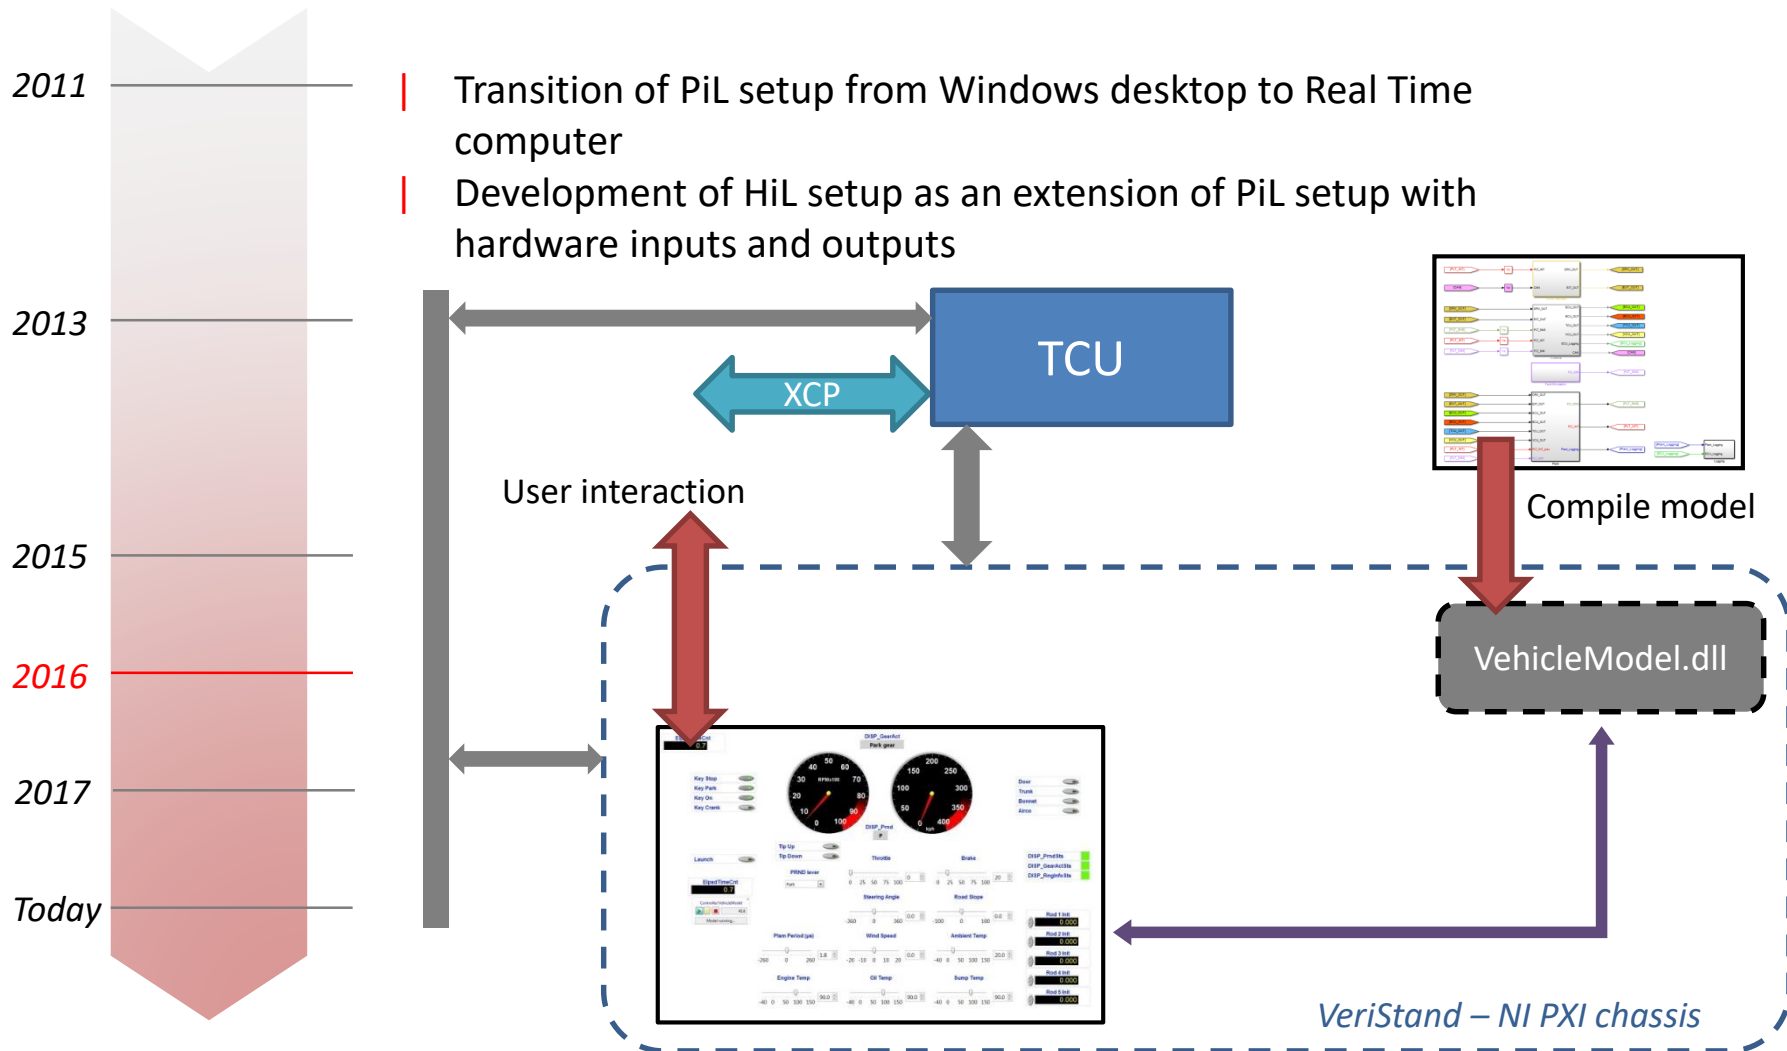

Performant Simulation Environment

Virtual TCU enables flexible ASW testing

Performant Simulation Environment

Extension of testing equipment with HiL

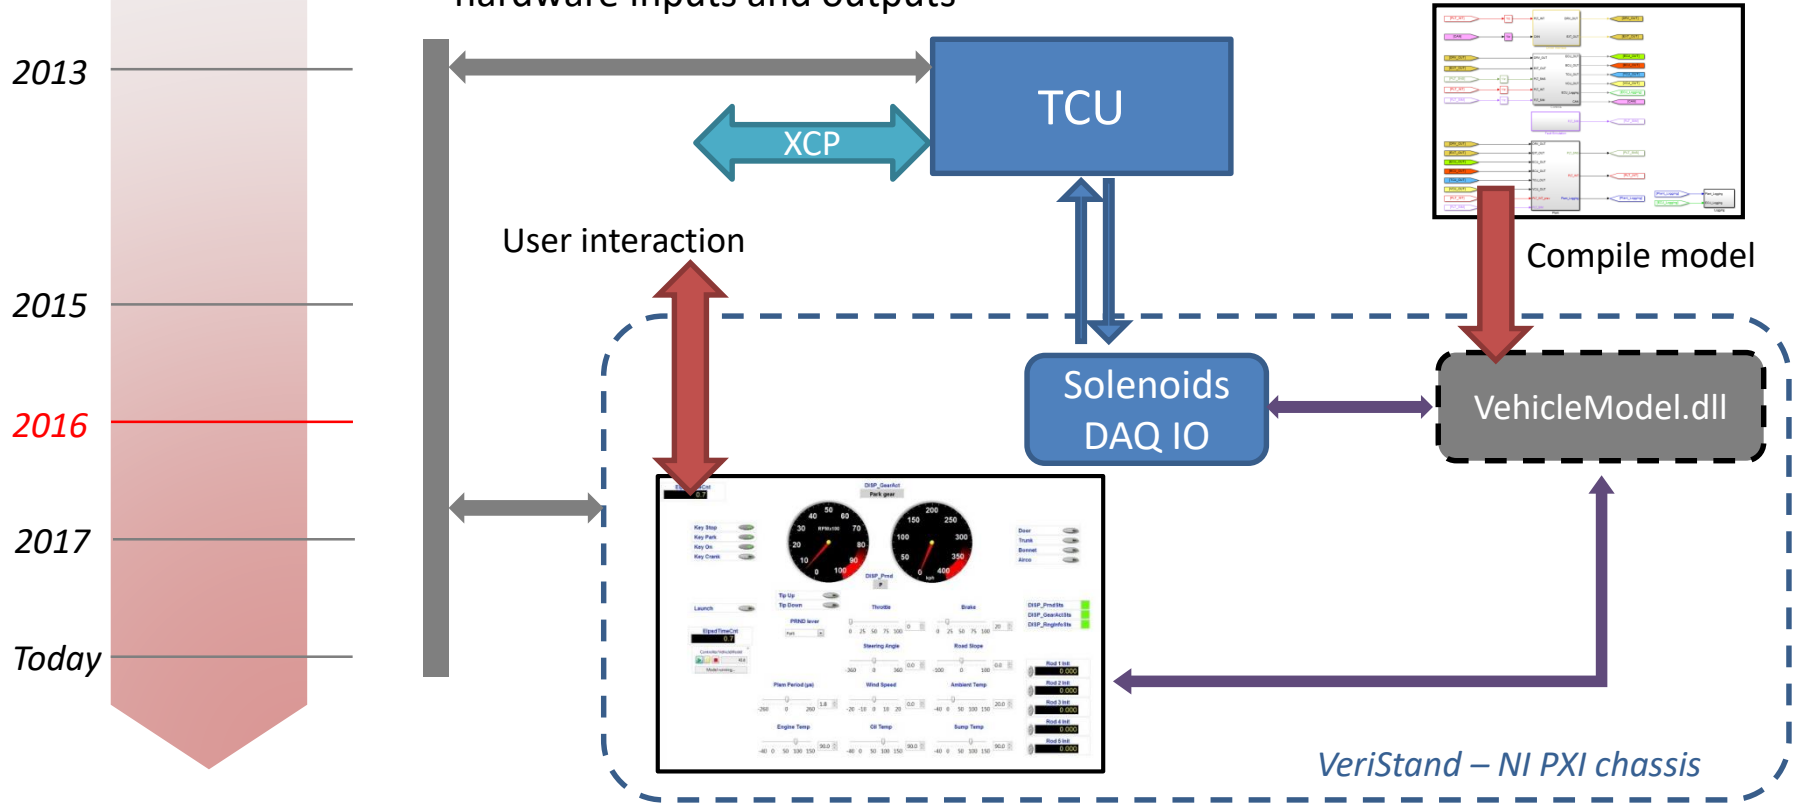

Performant Simulation Environment

Extension of testing equipment with HiL

- 2011 | Transition of PiL setup from Windows desktop to Real Time computer
- 2013 | Development of HiL setup as an extension of PiL setup with hardware inputs and outputs

TestWeaver is used for regression testing and software release validation

2011

Regression testing using TestWeaver

Weekly TestWeaver run

- Python scripts for regression
- Automatic script generation

Adp function	Adp result	Eol status check	online status check	reset to default status check	reset to default value check	Eol data check

2013

2015

2016

2017

Today

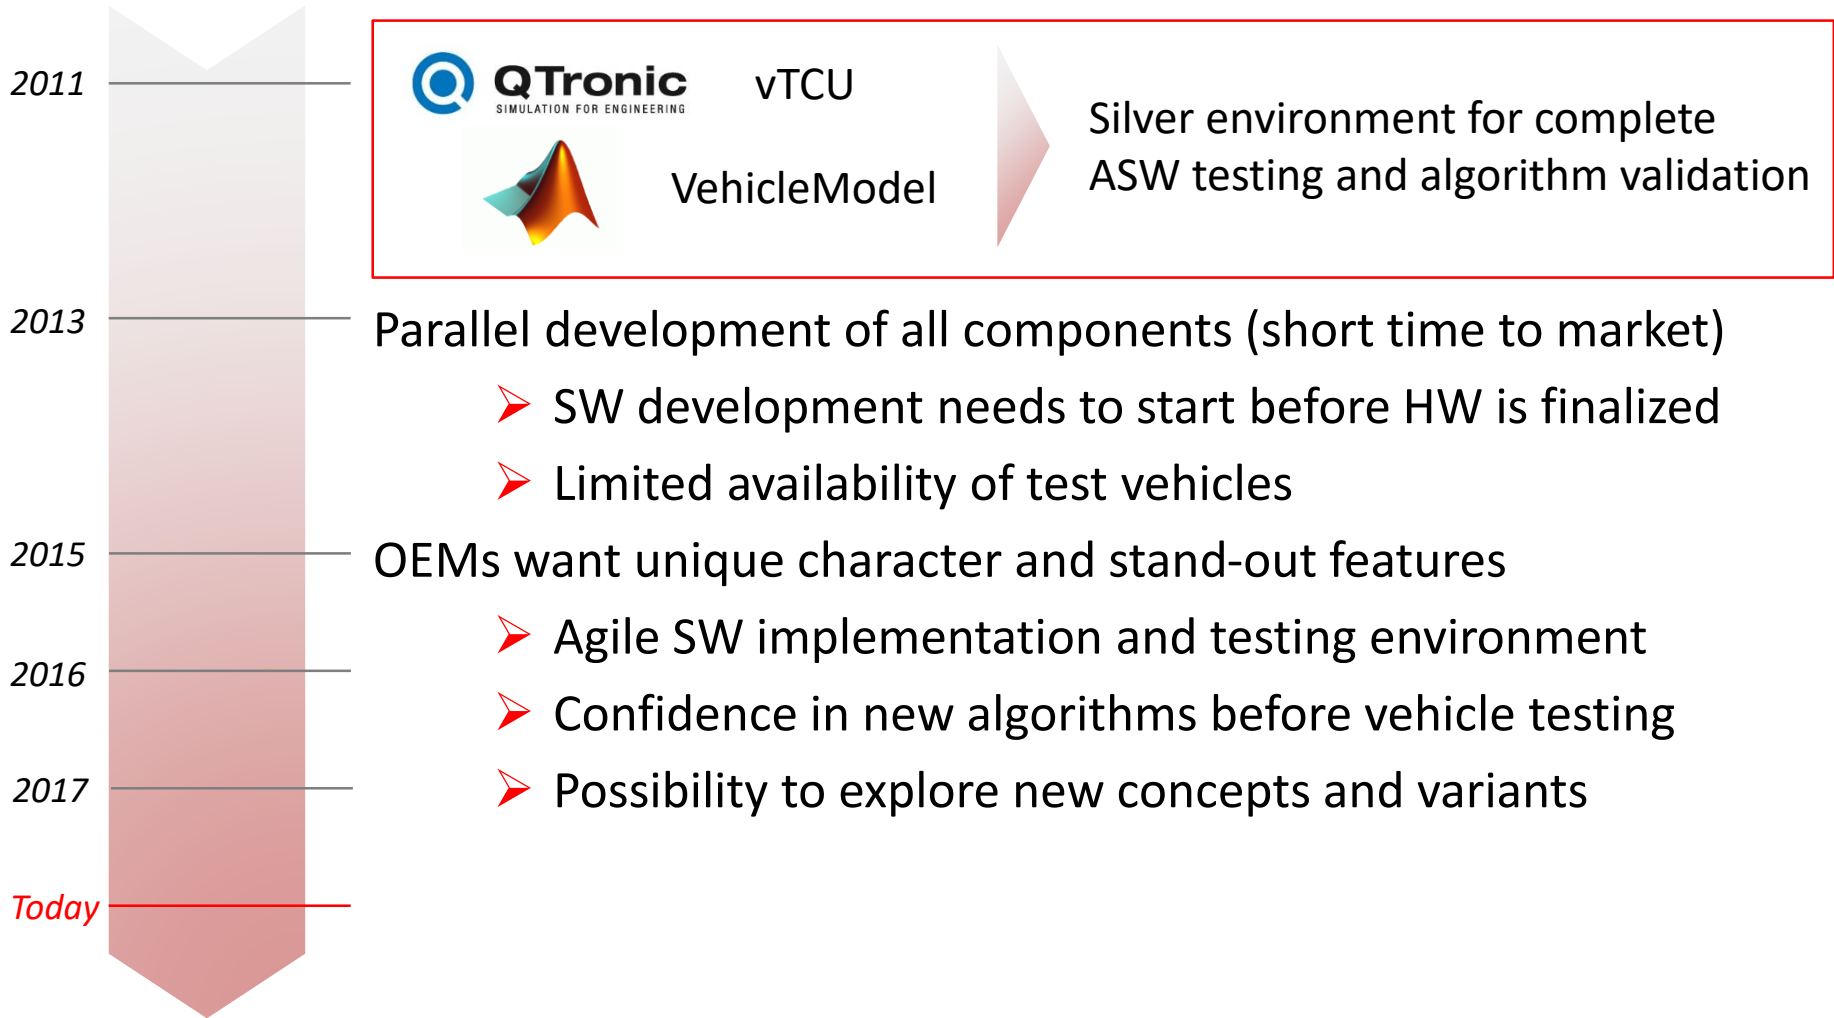

SW release TestWeaver run

- Regression test of diagnostic routines
- Release documentation

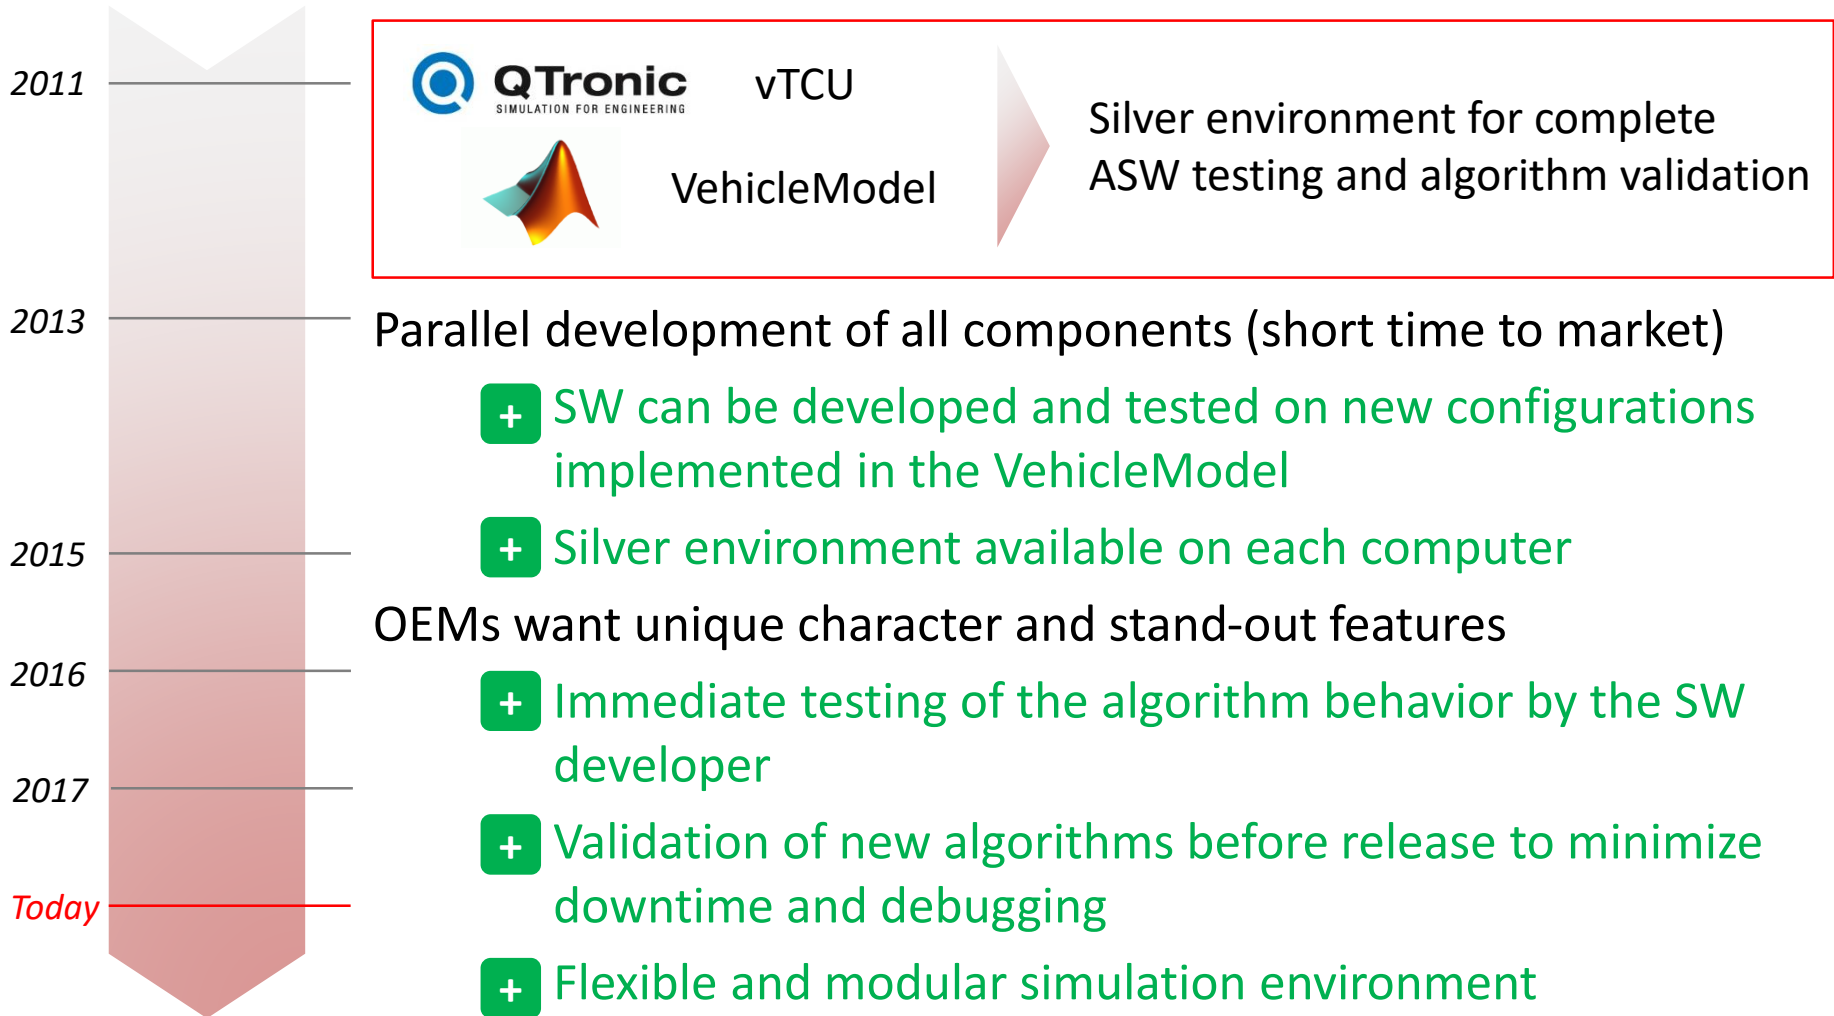

Performant Simulation Environment

Advantages of full virtual testing

Performant Simulation Environment

Advantages of full virtual testing

Proof Of Concept for new projects and algorithms

E-motor

High performance Hybrid DCT

- Shadow shifting
- Flying starts
- Boosted driving

Interface definition

Simulation model update

Test algorithms by sharing simulation files with OEM

Successful testing on the first prototype vehicle

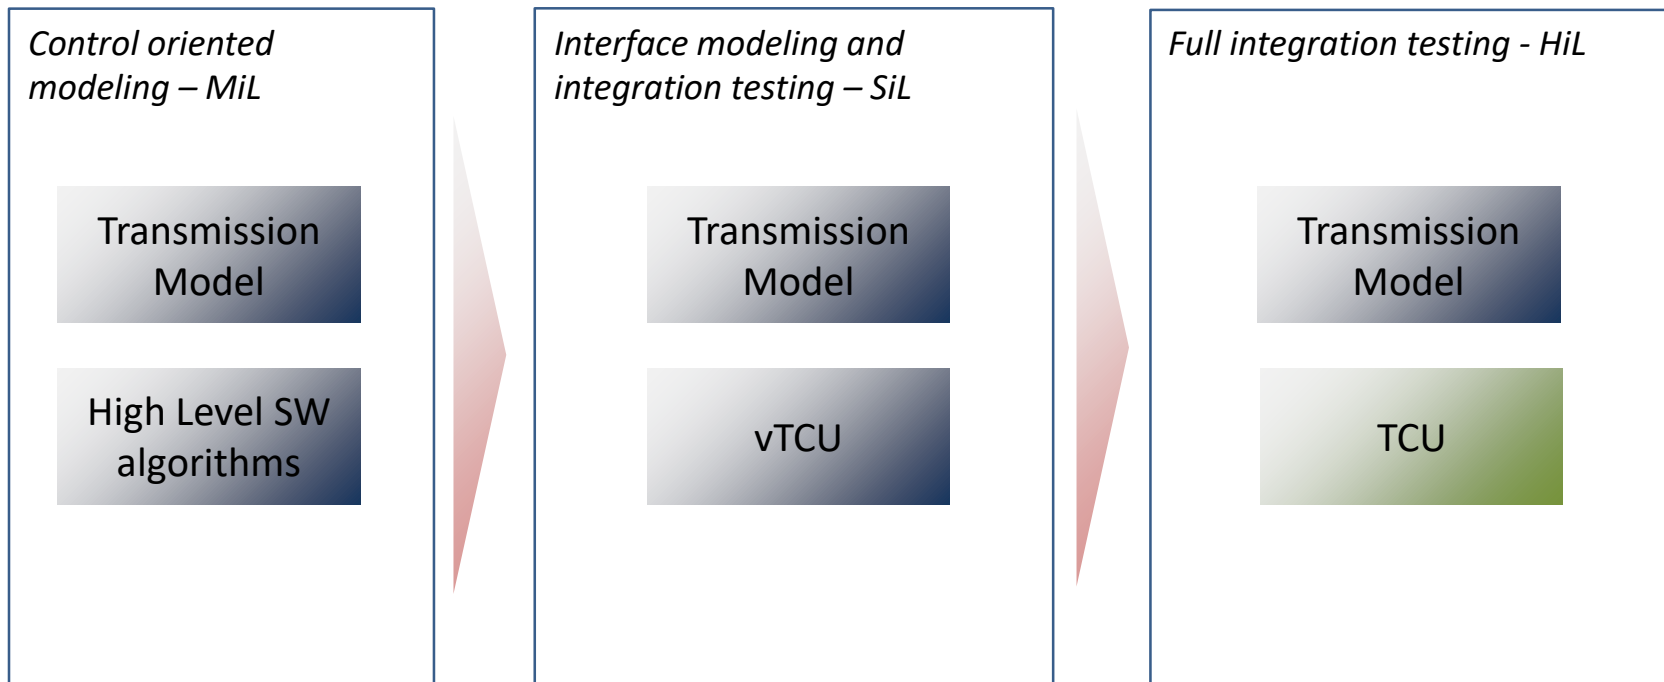

Tremec has developed State of the Art simulation and testing capabilities

Multiple methods for simulation to enable virtual SW development

- Modular simulation components that can be protected and shared
- Support for different testing methods and toolchains
